

## **Could not get SCCM admin console to connect to site db - had to Perform site maintenance or reset site**

[Marcus](#)

Just in case anyone gets stuck after installing anything, I thought I would write this up real quick. I could not get my sccm admin console to connect to the site db and finally got it working. Here are the steps:

1. Go to start, look for Microsoft system center
2. In that folder choose Config manager setup
3. Once it loads up hit next and choose the Perform site maintenance or reset site option
4. Click next, choose the top option, Reset site with no config changes
5. Hit next and it will go through the process of stopping services and re-applying permissions.

Once that's done, try to launch the admin console again and it should connect and load up like normal. Hope it helps if it happens to anyone else. Thanks
