Prerequisite Error Fix

Fix for error message – An error has occurred while attempting to download or verify required prerequisites components and setup cannot continue.

David True (one of my students) tried this version and it worked for him. Also this is working as well as for other students.

Try this version of Endpoint Configuration Manager, this appears to fix this problem.

https://www.microsoft.com/en-us/evalcenter/evaluate-microsoft-endpoint-configuration-manager

I extracted to Documents folder and ran splash.

Clicked on Download required prerequisites file

Saved then in a folder called Prerequisites

Once completed I clicked install and followed along with the lesson 30 - hope it works for others.
